Instructions for Authors
Symposia for CORR

CLINICAL ORTHOPAEDICS AND RELATED RESEARCH®

SUBMITTING A MANUSCRIPT FOR PROCEEDINGS ISSUES IN CORR®

Type of Articles Requested
CORR is a peer-reviewed journal that publishes original research. Articles for proceedings, just as unsolicited articles, must pass peer review. All articles should be based on previously unpublished data, unless they are systematic reviews, meta analyses, or economic analyses. The primary article types are:
• Clinical research (Level-IV or higher)
• Basic science research (original results from laboratory or animal experiments)
• Systematic review / meta analysis / decision analysis

Question-Driven Research
All research in CORR is question-driven. Questions must be specific, and framed around testable endpoints. This applies equally to the level-IV case series (what specific questions made you want to look up that group of patients?), as to surgical techniques (what deficiencies in the existing techniques did you try to remedy, and how do you know that you succeeded in doing so?), as to systematic reviews (what, specifically, would you like to learn by surveying the literature?), or to basic science.

Peer Review
All scientific articles in CORR, including articles for society proceedings, are peer reviewed. Your submission will be peer reviewed. The nature of peer review does not permit us to guarantee that your paper will be published. However, if your submission includes original research, asks good questions, answers them using a rigorous approach, and follows the author guidelines, the likelihood is high that it will. We generally try to invite at least one society member to review papers from the society’s meeting, but generally there are more manuscripts submitted than there are willing society members to review them. You can help by performing reviews on these papers when requested to do so. As with all CORR manuscripts, a final decision on publication lies with the Editor-in-Chief, although on close calls we generally seek the concurrence of the Guest Editor.

Templates for Manuscript Preparation, Submission Instructions, and Forms:
Please use one of our three templates (clinical, laboratory research, or systematic review), depending upon the kind of study you are writing. They are available at:
http://www.clinorthop.org/tools-for-authors.

To submit your manuscript on line:
Register >
Log-in >
Submit manuscript >
Select article type >
Select “Symposium / Proceedings / Workshop” >
Select “Section/Category” - select your symposium (they are clearly identified by name and guest editor).
Make sure to include all the forms specified in instructions to authors (including Copyright Transfer, Conflict of Interest / ICMJE, and authorship responsibility forms).

**Fast Track Publication:**
All symposia are fast tracked and scheduled with deadlines. Manuscripts are processed in the order received. CORR has “electronic-publish-ahead-of-print” which ensures the PubMed availability of the authors’ material well before print publication. Our average time from submission to transmittal is about 110 days, and articles are published electronically about 2 weeks after transmittal - a quick turnaround!

**References**
We use the Modified JAMA Format: The modifications are as follows: (1) we list all authors (rather than the first six), (2) references appear in alphabetical order and numbered (rather than numbered in order of appearance in the text), (3) official Medline journal abbreviations are allowed and these must be italicized.

**Supplemental electronic material:**
We can incorporate supplementary electronic material online. We encourage those of you with video clips or animation in your paper to contact us for further guidelines.

**Transfer Agreements:**
The transfer agreements may be downloaded from “Instructions for Authors” at our submission website and modified as appropriate. They include: Copyright Transfer Agreement, Authorship Responsibility, Financial Disclosure, Government Work Statement, and Disclosure Regarding Commercial Interests. We now adhere to the International Committee of Medical Journal Editors (ICMJE) guidelines on reporting conflict of interest.

**General comments:**
The “Top-5” problems causing rejections or extra manuscript revisions in proceedings are:
1. Research doesn’t pose clear questions. Pose 2-4 specific questions or purposes in the Abstract and at the end of the Introduction. Answer those questions sequentially in the Results, and explore them in order in the Discussion. Ask yourself: “What are the key messages I want readers to remember?” Formulate questions/purposes based on those messages.
2. Patient populations are not adequately defined.
3. Study limitations are not explored in the second paragraph of the Discussion.
4. References: Uncited, missing, or not in CORR format.
5. “Book chapter style” (selective) review article submitted instead of original research or systematic review / meta analysis. We generally don’t publish selective reviews.

**Questions:** Please call the CORR offices at 215 392 0270 or the guest editor.
